

## Prescribe iOS Description

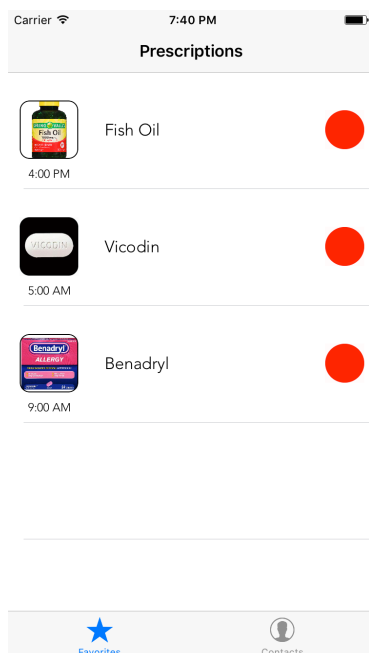

### Installation Instruction

- Requires Xcode/Mac to run.
- App runs on iOS 10.1.
- Open the Prescribe.xcworkspace file, choose a build target, and then click "Build".

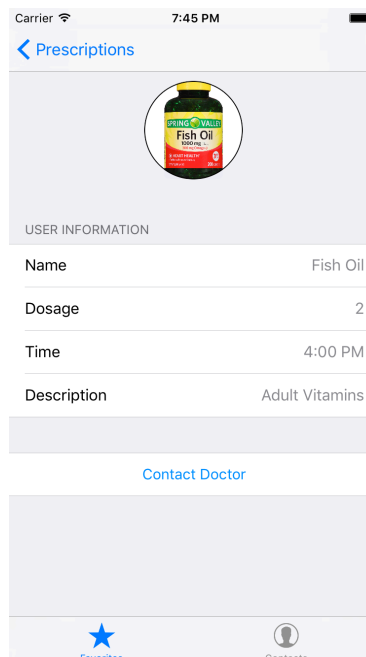

### General Overview

- This app is a client-facing application which manages when and which pills should be dispensed for the user.
- It can be used by the caregiver or the recipient.
- It keeps track of local health information and provides notifications of when to take pills.

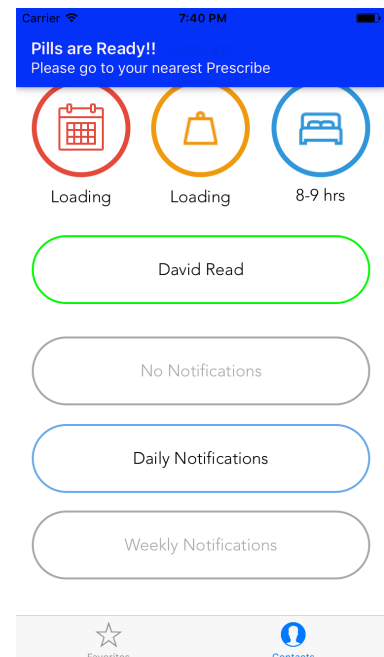

#### Home Page

#### Pill Description Page

#### Personal Info Page

### Home Page

- This section is where all the pills for the user are stored and when to take them.
- The right image turns green when the pills have successfully been taken for the day.

### Pill Description Page

- This section describes the specific pill name, dosage, time to dispense, and description.
- If you have questions, we have also integrated a contact doctor button.

### Personal Info Page

- This section keeps track of local health data using HealthKit. This information is also pushed up to our server for pharmacists to view.
- You can also set the notification frequency on this page.
